

EXTENDED TEMPERATURE RANGE

PIC series microcomputers are available in two temperature ranges. The preceding data sheets describe the commercial grade device, 0°C to 70°C centigrade. An industrial/automotive temperature range version is available. The -40° to 85° centigrade option is specified with the addition of a suffix, I, to the part number.

The specifications for these devices differ from their commercial grade counterparts in a few electrical parameters, typically interface voltage/current levels. Refer to the data sheets for details.

OPEN DRAIN OPTIONS

PIC1650A, PIC1670

Open-Drain I/O Ports

Any or all of the I/O lines may be specified by the customer to be open drain, that is, the internal pull-up device will be removed. This enables the outputs to be pulled up to +10.0V maximum with an external pull-up resistor, allowing easy interface to external devices requiring a logic one level greater than V_{DD} of the PIC. In the logic one state, the leakage current of the I/O port is $\pm 5\mu A$, maximum.

The customer shall specify on the "PIC Series Order Form" the pin number and port name (e.g., "RB3") of each port required to be open drain.

PIC1655A, PIC1656

Open Drain I/O, Input and Output Ports

Any or all of the I/O, input only or output only lines may be specified by the customer to be open drain, that is, the internal pull-up device will be removed. This enables the outputs to be pulled up to +10.0V maximum with an external pull-up resistor, allowing easy interface to external devices requiring a logic one

level greater than V_{DD} of the PIC. In the logic one state, the leakage current of the I/O port is $\pm 5\mu A$, maximum.

The customer shall specify on the "PIC Series Order Form" the pin number and port name (e.g., "RB3") of each port required to be open drain.

PIC16C55

Input-only, Output-only and I/O Ports

Any or all of the input-only and I/O lines may be specified to have an internal pull-up resistor inserted via a mask option. This allows easy interface to an external transistor or switch without the need for an external pull-up resistor. Furthermore, any or all of the output-only or I/O pull-down transistors can be specified to be removed via a mask option. This facilitates interfacing with external circuitry which has signal swings below V_{SS} . In this case the maximum voltage permitted to be applied to the pin is -12V with respect to V_{DD} .

PIC1654

Optional Internal Connection to RTCC

A mask option will allow an internal clock signal whose period is equal to the instruction execution time to drive the real time clock/counter register. In this mode, transitions in the RTCC pin will be disregarded.

PIC1655XT

Prescaler Division Ratio

A mask option will allow the division ratio of the RTCC prescaler to be selected as 1, 2, 4, 8 or 16. Consult the data sheet for the details.

8 Bit Microcomputer

FEATURES

- User programmable
- Intelligent controller for stand-alone applications
- 32 8-bit RAM registers
- 512 x 12-bit program ROM
- Arithmetic Logic Unit
- Real Time Clock/Counter
- Self-contained oscillator
- Access to RAM registers inherent in instruction
- Wide power supply operating range (4.5V to 7.0V)
- Available in two temperature ranges: 0° to 70° C and -40° to 85° C
- 4 inputs, 8 outputs, 8 bi-directional I/O lines
- 2 level stack for subroutine nesting

DESCRIPTION

The PIC1655A microcomputer is an MOS/LSI device containing RAM, I/O, and a central processing unit as well as customer-defined ROM on a single chip. This combination produces a low cost solution for applications which require sensing individual inputs and controlling individual outputs. Keyboard scanning, display driving, and other system control functions can be done at the same time due to the power of the 8-bit CPU.

The internal ROM contains a customer-defined program using the PIC's powerful instruction set to specify the overall functional characteristics of the device. The 8-bit input/output registers provide latched lines for interfacing to a limitless variety of applications. The PIC can be used to scan keyboards, drive displays, control electronic games and provide enhanced capabilities to vending machines, traffic lights, radios, television, consumer appliances, industrial timing and control applications. The 12-bit instruction word format provides a powerful yet easy to use

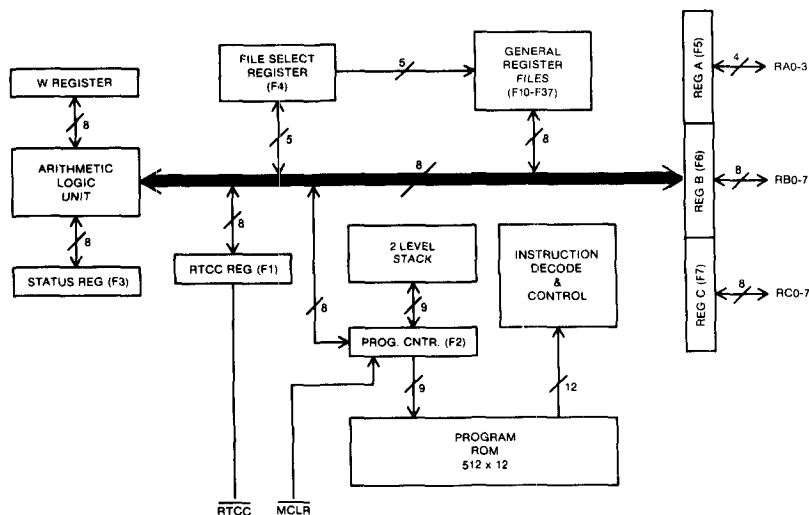

instruction repertoire emphasizing single bit manipulation as well as logical and arithmetic operations using bytes.

The PIC1655A is fabricated with N-Channel Ion Implant technology resulting in a high performance product with proven reliability and production history. Only a single wide range power supply is required for operation, and an on-chip oscillator provides the operating clock with only an external RC network (or buffered crystal oscillator signal, for greater accuracy) to establish the frequency. Inputs and outputs are TTL-compatible.

Extensive hardware and software support is available to aid the user in developing an application program and to verify performance before committing to mask tooling. Programs can be assembled into machine language using PICAL, eliminating the burden of coding with ones and zeros. PICAL is available in a Fortran IV version that can be run on many popular computer systems. Once the application program is developed several options are available to insure proper performance. The PIC's operation can be verified in any hardware application by using the PIC1664. The PIC1664 is a ROM-less PIC microcomputer with additional pins to connect external PROM or RAM and to accept HALT commands. The PFD1000 Field Demo System is available containing a PIC1664 with sockets for erasable CMOS PROMs. Finally, the PICES II (PIC In-Circuit Emulation System) provides the user with emulation and debugging capability in either a stand-alone mode or operation as a peripheral to a larger computer system. Easy program debugging and changing is facilitated because the user's program is stored in RAM. With these development tools, the user can quickly and confidently order the masking of the PIC's ROM and bring his application into the market.

A PIC Series Microcomputer Data Manual is available which gives additional detailed data on PIC based system design.

PIC1655A BLOCK DIAGRAM

ARCHITECTURAL DESCRIPTION

The firmware architecture of the PIC series microcomputer is based on a register file concept with simple yet powerful commands designed to emphasize bit, byte, and register transfer operations. The instruction set also supports computing functions as well as these control and interface functions.

Internally, the PIC is composed of three functional elements connected together by a single bidirectional bus: the Register File composed of 32 addressable 8-bit registers, an Arithmetic Logic Unit, and a user-defined Program ROM composed of 512 words each 12 bits in width. The Register File is divided into two functional groups: operational registers and general registers. The operational registers include, among others, the Real Time Clock Counter Register, the Program Counter (PC), the Status Register,

and the I/O Registers. The general purpose registers are used for data and control information under command of the instructions. The Arithmetic Logic Unit contains one temporary working register or accumulator (W Register) and gating to perform Boolean functions between data held in the working register and any file register.

The Program ROM contains the operational program for the rest of the logic within the controller. Sequencing of microinstructions is controlled via the Program Counter (PC) which automatically increments to execute in-line programs. Program control operations can be performed by Bit Test and Skip instructions, Jump instructions, Call instructions, or by loading computed addresses into the PC. In addition, an on-chip two-level stack is employed to provide easy to use subroutine nesting. Activating the MCLR input on power up initializes the ROM program to address 777_h.

PIN FUNCTIONS

Signal	Function
OSC (input)	Oscillator input. This signal can be driven by an external oscillator if a precise frequency of operation is required or an external RC network can be used to set the frequency of operation of the internal clock generator. This is a Schmitt trigger input.
RTCC (input)	Real Time Clock Counter. Used by the microprogram to keep track of elapsed time between events. The RTCC register increments on falling edges applied to this pin. This register can be loaded and read by the program. This is a Schmitt trigger input.
RA0-3 (input)	4 input lines.
RB0-7 (output)	8 output lines.
RC0-7 (input/output)	8 user programmable input/output lines.
MCLR (input)	Master Clear. Used to initialize the internal ROM program to address 777 _h and latch all I/O register high. Should be held low at least 1ms past the time when the power supply is valid. This is a Schmitt trigger input.
CLK OUT (output)	A signal derived from the internal oscillator. Used by external devices to synchronize themselves to PIC timing.
TEST	Used for testing purposes only. Must be grounded for normal operation.
V _{DD}	Primary power supply.
V _{XX}	Output Buffer power supply. Used to enhance output current sinking capability.
V _{SS}	Ground

MICROCOMPUTER

REGISTER FILE ARRANGEMENT

File (Octal)	Function																
F0	Not a physically implemented register. F0 calls for the contents of the File Select Register (low order 5 bits) to be used to select a file register. F0 is thus useful as an indirect address pointer. For example, W+F0-W will add the contents of the file register pointed to by the FSR (F4) to W and place the result in W.																
F1	Real Time Clock Counter Register. This register can be loaded and read by the microprogram. The RTCC register keeps counting up after zero is reached. The counter increments on the falling edge of the input RTCC. However, if data are being stored in the RTCC register simultaneously with a negative transition on the RTCC pin, the RTCC register will contain the new stored value and the external transition will be ignored by the microcomputer.																
F2	Program Counter (PC). The PC is automatically incremented during each instruction cycle, and can be written into under program control (MOVWF F2). The PC is nine bits wide, but only its low order 8 bits can be read under program control.																
F3	Status Word Register. F3 can be altered under program control only via bit set, bit clear, or MOVWF F3 instruction.																
	<table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>(7)</th> <th>(6)</th> <th>(5)</th> <th>(4)</th> <th>(3)</th> <th>(2)</th> <th>(1)</th> <th>(0)</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>1</td> <td>1</td> <td>1</td> <td>1</td> <td>Z</td> <td>DC</td> <td>C</td> </tr> </tbody> </table>	(7)	(6)	(5)	(4)	(3)	(2)	(1)	(0)	1	1	1	1	1	Z	DC	C
(7)	(6)	(5)	(4)	(3)	(2)	(1)	(0)										
1	1	1	1	1	Z	DC	C										
	<p>C (Carry): For ADD and SUB instructions, this bit is set if there is a carry out from the most significant bit of the resultant. For ROTATE instructions, this bit is loaded with either the high or low order bit of the source.</p> <p>DC (Digit Carry): For ADD and SUB instructions, this bit is set if there is a carry out from the 4th low order bit of the resultant.</p> <p>Z (Zero): Set if the result of an arithmetic operation is zero.</p> <p>Bits: 3-7 These bits are defined as logic ones.</p>																
F4	File Select Register (FSR). Low order 5 bits only are used. The FSR is used in generating effective file register addresses under program control. When accessed as a directly addressed file, the upper 3 bits are read as ones.																
F5	Input Register A (A0-A3) (A4-A7 defined as zeroes).																
F6	Output Register B (B0-B7)																
F7	I/O Register C (C0-C7)																
F10-F37	General Purpose Registers																

Basic Instruction Set Summary

Each PIC instruction is a 12-bit word divided into an OP code which specifies the instruction type and one or more operands which further specify the operation of the instruction. The following PIC instruction summary lists byte-oriented, bit-oriented, and literal and control operations.

For byte-oriented instructions, "f" represents a file register designator and "d" represents a destination designator. The file register designator specifies which one of the 32 PIC file registers is to be utilized by the instruction. The destination designator specifies where the result of the operation performed by the instruction is to be placed. If "d" is zero, the result is placed in the

PIC W register. If "d" is one, the result is returned to the file register specified in the instruction.

For bit-oriented instructions, "b" represents a bit field designator which selects the number of the bit affected by the operation, while "f" represents the number of the file in which the bit is located.

For literal and control operations, "k" represents an eight or nine bit constant or literal value.

For an oscillator frequency of 1MHz the instruction execution time is 4 μ sec, unless a conditional test is true or the program counter is changed as a result of an instruction. In these two cases, the instruction execution time is 8 μ sec.

110 1kk kkk kkk (6400)	Inclusive OR Literal and W	IORLW k	kVW ← W	Z
111 0kk kkk kkk (7000)	AND Literal and W	ANDLW k	k ← W - W	Z
111 1kk kkk kkk (7400)	Exclusive OR Literal and W	XORLW k	k ← W - W	Z

NOTES:

- The 9th bit of the program counter in the PIC is zero for a CALL and a MOVWF F2. Therefore, subroutines must be located in program memory locations 0-377_h. However, subroutines can be called from anywhere in the program memory since the Stack is 9 bits wide.
- When an I/O register is modified as a function of itself, the value used will be that value present on the output pins. For example, an output pin which has been latched high but is driven low by an external device, will be relatched in the low state.

SUPPLEMENTAL INSTRUCTION SET SUMMARY

The following supplemental instructions summarized below represent specific applications of the basic PIC instructions. For example, the "CLEAR CARRY" supplemental instruction is equiv-

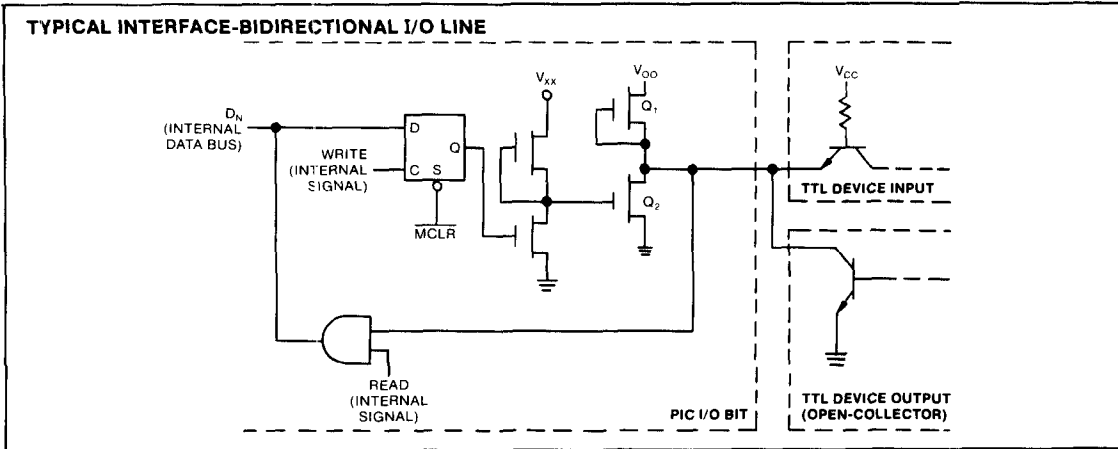

alent to the basic instruction BCF 3,0 ("Bit Clear, File 3, Bit 0"). These instruction mnemonics are recognized by the PIC Cross Assembler (PICAL).

Instruction-Binary (Octal)	Name	Mnemonic, Operands	Equivalent Operation(s)	Status Affected
010 000 000 011 (2003)	Clear Carry	CLRC	BCF 3, 0	—
010 100 000 011 (2403)	Set Carry	SETC	BSF 3, 0	—

I/O Interfacing

The equivalent circuit for an I/O port bit is shown below as it would interface with either the input of a TTL device (PIC is outputting) or the output of an open collector TTL device (PIC is inputting). Each I/O port bit can be individually time multiplexed between input and output functions under software control. When outputting thru a PIC I/O Port, the data is latched at the port and the pin

can be connected directly to a TTL gate input. When inputting data thru an I/O Port, the port latch must first be set to a high level under program control. This turns off Q_2 , allowing the TTL open collector device to drive the pad, pulled up by Q_1 , which can source a minimum of $100\mu A$. Care, however, should be exercised when using open collector devices due to the potentially high TTL leakage current which can exist in the high logic state.

Bidirectional I/O Ports

The bidirectional ports may be used for both input and output operations. For input operations these ports are non-latching. Any input must be present until read by an input instruction. The outputs are latched and remain unchanged until the output latch is rewritten. **For use as an input port the output latch must be set in the high state.** Thus the external device inputs to the PIC circuit by forcing the latched output line to the low state or keeping the latched output high. This principle is the same whether operating on individual bits or the entire port.

Some instructions operate internally as input followed by output operations. The BCF and BSF instructions, for example, read the entire port into the CPU, execute the bit operation, and re-output the result. Caution must be used when using these instructions. As an example a BSF operation on bit 5 of F7 (port RC) will cause all eight bits of F7 to be read into the CPU. Then the BSF operation takes place on bit 5 and F7 is re-output to the output latches. If another bit of F7 is used as an input (say bit 0) then bit 0 must be latched high. If during the BSF instruction on bit 5 an external device is forcing bit 0 to the low state then the input/output nature of the BSF instruction will leave bit 0 latched low after execution. In this state bit 0 cannot be used as an input until it is again latched high by the programmer. Refer to the examples below.

Input Only Port: (Port RA)

The input only port of the PIC1655A consists of the four LSB's of F5 (port RA). An internal pull-up device is provided so that external pull-ups on open collector logic are unnecessary. The four MSB's of this port are always read as zeroes. Output operations to F5 are not defined. Note that the BTFSC and BTFSS instructions are input only operations and so can be used with F5. Also, file register instructions which leave the results in W can be used.

Output Only Port: (Port RB)

The output only port of the PIC1655A consists of F6 (port RB). This port contains no input circuitry and is therefore not capable of instructions requiring an input followed by an output operation. The only instructions which can validly use F6 are MOVWF and CLRF.

Successive Operations on Bidirectional I/O Ports

Care must be exercised if successive instructions operate on the same I/O port. The sequence of instructions should be such to allow the pin voltage to stabilize (load dependent) before the next instruction which causes that file to be read into the CPU (MOVWF, BIT SET, BIT CLEAR, and BIT TEST) is executed. Otherwise, the previous state of that pin may be read into the CPU rather than the new state. This will happen if t_{pd} (See I/O Timing Diagram) is greater than $\frac{1}{4}t_{cy}$ (min). When in doubt, it is better to separate these instructions with a NOP or other instruction.

MICROCOMPUTER

EXAMPLE 1:

What is thought to be happening:
BSF 7,5
Read into CPU: 00001111
Set bit 5: 00101111
Write to F7: 00101111

If no inputs were low during the instruction execution, there would be no problem.

EXAMPLE 2:

What could happen if an input were low:
BSF 7,5
Read into CPU: 00001110
Set bit 5: 00101110
Write to F7: 00101110

In this case bit 0 is now latched low and is no longer useful as an input until set high again.

ELECTRICAL CHARACTERISTICS

Maximum Ratings*

Ambient temperature Under Bias 125°C
 Storage Temperature -55°C to +150°C
 Voltage on any pin with Respect to V_{SS} -0.3V to +10.0V
 Power Dissipation (Note 1) 1000mW

* Exceeding these ratings could cause permanent damage to the device. This is a stress rating only and functional operation of this device at these conditions is not implied—operating ranges are specified in Standard Conditions. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Data labeled "typical" is presented for design guidance only and is not guaranteed.

Standard Conditions (unless otherwise stated):

DC CHARACTERISTICS/PIC1655A

Operating Temperature $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$

Output Low Voltage (CLK OUT)	V_{OL2}	—	—	0.45	V	$I_{OL} = 1.6\text{mA}$ (Note 5)
Input Leakage Current (MCLR, RTCC)	I_{LC}	-5	—	+5	μA	$V_{SS} \leq V_{IN} \leq V_{DD}$
Output Leakage Current (open drain I/O pins)	I_{OLC}	—	—	10	μA	$V_{SS} \leq V_{PIN} \leq 10\text{V}$
Input Low Current (all I/O ports)	I_{IL}	-0.2	-0.6	-1.6	mA	$V_{IL} = 0.4\text{V}$ internal pullup
Input High Current (all I/O ports)	I_{IH}	-0.1	-0.4	-1.4	mA	$V_{IH} = 2.4\text{V}$

† Typical data is at $T_A = 25^\circ\text{C}$, $V_{DD} = 5.0\text{V}$.

NOTES:

- Total power dissipation for the package is calculated as follows:
 $P_D = (V_{DD}) (I_{DD}) + \Sigma (V_{DD} - V_{IL}) (|I_{IL}|) + \Sigma (V_{DD} - V_{OH}) (|I_{OH}|) + \Sigma (V_{OL}) (I_{OL})$.
 The term I/O refers to all interface pins; input, output or I/O.
- V_{XX} supply drives only the I/O ports.
- The maximum I_{XX} current will be drawn when all I/O ports are outputting a High.
- Positive current indicates current into pin. Negative current indicates current out of pin.
- Total I_{OL} for all output pins (I/O ports plus CLK OUT) must not exceed 225mA.

DC CHARACTERISTICS/PIC1655AIOperating Temperature $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$

Characteristic	Sym	Min	Typ†	Max	Units	Conditions
Primary Supply Voltage	V_{DD}	4.5	—	7.0	V	
Output Buffer Supply Voltage	V_{XX}	4.5	—	10.0	V	(Note 2)
Primary Supply Current	I_{DD}	—	30	60	mA	All I/O pins @ V_{DD}
Output Buffer Supply Current	I_{XX}	—	1	5	mA	All I/O pins @ V_{OD} (Note 3)
Input Low Voltage	V_{IL}	-0.2	—	0.7	V	
Input High Voltage (except MCLR, RTCC & OSC)	V_{IH}	2.4	—	V_{DD}	V	
Input Low-to-High Threshold Voltage (MCLR, RTCC & OSC)	V_{ILH}	$V_{DD}-1$	2.6	V_{DD}	V	
Output High Voltage	V_{OH}	2.4	—	V_{DD}	V	$I_{OH} = -100\mu\text{A}$ (Note 4) $I_{OH} = 0$
Output Low Voltage (I/O only)	V_{OL1}	—	—	0.45	V	$I_{OL} = 1.6\text{mA}$, $V_{XX} = 4.5\text{V}$
		—	—	0.90	V	$I_{OL} = 5.0\text{mA}$, $V_{XX} = 4.5\text{V}$
		—	—	0.90	V	$I_{OL} = 5.0\text{mA}$, $V_{XX} = 8.0\text{V}$
		—	—	1.20	V	$I_{OL} = 10.0\text{mA}$, $V_{XX} = 8.0\text{V}$
		—	—	2.0	V	$I_{OL} = 20.0\text{mA}$, $V_{XX} = 8.0\text{V}$ (Note 5)
Output Low Voltage (CLK OUT)	V_{OL2}	—	—	0.45	V	$I_{OL} = 1.6\text{mA}$ (Note 5)
Input Leakage Current (MCLR, RTCC)	I_{LC}	-5	—	+5	μA	$V_{SS} \leq V_{IN} \leq V_{DD}$
Output Leakage Current (open drain I/O pins)	I_{OLC}	—	—	10	μA	$V_{SS} \leq V_{PIN} \leq 10\text{V}$
Input Low Current (all I/O ports)	I_{IL}	-0.2	-0.6	-1.8	mA	$V_{IL} = 0.4\text{V}$ internal pullup
Input High Current (all I/O ports)	I_{IH}	-0.1	-0.4	-1.8	mA	$V_{IH} = 2.4\text{V}$

†Typical data is at $T_A = 25^\circ\text{C}$, $V_{DD} = 5.0\text{V}$.

NOTES:

- Total power dissipation for the package is calculated as follows:
 $P_D = (V_{DD})(I_{DD}) + \Sigma (V_{DD} - V_{IL})(I_{IL}) + \Sigma (V_{DD} - V_{OH})(I_{OH}) + \Sigma (V_{OL})(I_{OL})$.
 The term I/O refers to all interface pins; input, output or I/O.
- V_{XX} supply drives only the I/O ports.
- The maximum I_{XX} current will be drawn when all I/O ports are outputting a High.

- Positive current indicates current into pin.
Negative current indicates current out of pin.
- Total I_{OL} for all output pins (I/O ports plus CLK OUT) must not exceed 225mA.

Standard Conditions (unless otherwise stated):

AC CHARACTERISTICS/PIC1655A, PIC1655AIOperating Temperature $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$ (PIC1655A), $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ (PIC1655AI)

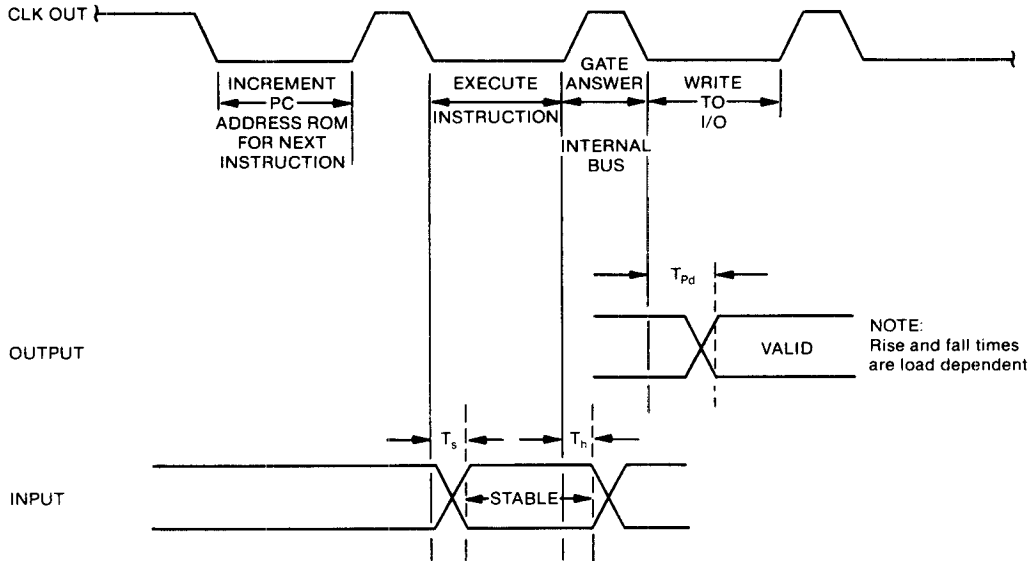

Characteristic	Sym	Min	Typ†	Max	Units	Conditions
Instruction Cycle Time	t_{CY}	4	—	20	μs	0.2MHz — 1.0MHz external time base (Note 1)
RTCC Input						
Period	t_{RT}	$t_{CY} + 0.2\mu\text{s}$	—	—	—	
High Pulse Width	t_{RTH}	$\frac{1}{2}t_{RT}$	—	—	—	
Low Pulse Width	t_{RTL}	$\frac{1}{2}t_{RT}$	—	—	—	(Notes 2 and 3)
I/O Ports						
Data Input Setup Time	t_S	—	—	$\frac{1}{4}t_{CY} - 125$	ns	
Data Input Hold Time	t_H	0	—	—	ns	
Data Output Propagation Delay	t_{pd}	—	600	1000	ns	Capacitive load = 50pF
OSC Input						
External Input Impedance High	R_{OSCH}	120	800	3500	Ω	$V_{OSC} = 5\text{V}$ } Applies to external $V_{OSC} = 0.4\text{V}$ } OSC drive only.
External Input Impedance Low	R_{OSCL}	—	10^6	—	Ω	

†Typical data is at $T_A = 25^\circ\text{C}$, $V_{DD} = 5.0\text{V}$.

NOTES:

- Instruction cycle period (t_{CY}) equals four times the input oscillator time base period.
- Due to the synchronous timing nature between CLK OUT and the sampling circuit used on the RTCC input, CLK OUT may be directly tied to the RTCC input.
- The maximum frequency which may be input to the RTCC pin is calculated as follows: $f_{(max)} = \frac{1}{t_{RT(min)}} = \frac{1}{t_{CY(min)} + 0.2\mu\text{s}}$
 For example: if $t_{CY} = 4\mu\text{s}$, $f_{(max)} = \frac{1}{4.2\mu\text{s}} = 238\text{KHz}$.

I/O TIMING

CLK OUT TIMING

RTCC TIMING

SCHMITT TRIGGER CHARACTERISTICS (RTCC, MCLR and OSC PINS) $T_A = 25^\circ\text{C}$ (TYPICAL)

- NOTES:
 1. Low-to-High Threshold Voltage (V_{TLH}).
 2. High-to-Low Threshold Voltage (V_{THL}).

PIC1655A OSCILLATOR OPTIONS (TYPICAL CIRCUITS)

RC OPTION OPERATION

INSTRUCTION CYCLE TIME (kHz)
 Oscillator Frequency With Typical Unit To Unit Variance
 Unit to Unit Variation at $V_{DD} = 5.0V$, $T_A = 25^\circ C$ is $\pm 25\%$
 Variation from $V_{DD} = 4.5V - 7.0V$ referenced to $5V$ is -3% , $+9\%$
 Variation from $T_A = 0^\circ C - 70^\circ C$ referenced to $25^\circ C$ is $+3\%$, -5%

BUFFERED CRYSTAL INPUT OPERATION

The buffer must be capable of driving 120Ω , min. (800Ω , typ.) to $2.0V$. However, it is recommended that the pull-down transistor on the OSC pin be removed (an option) if OSC is to be driven externally.

EXTERNAL CLOCK INPUT OPERATION

MICROCOMPUTER

MASTER CLEAR (TYPICAL CIRCUIT)

Master Clear requires >1.0ms delay before activation after power is applied to the V_{DD} pin, for the oscillator to start up. To achieve this, an external RC configuration as shown can be used (assuming V_{DD} is applied as a step function).

OUTPUT SINK CURRENT GRAPH

The Output Sink Current is dependent on the V_{XX} supply and the output load. This chart shows the typical curves used to express the output drive capability.

V_{OH} VS I_{OH} (I/O PORTS) (TYPICAL)

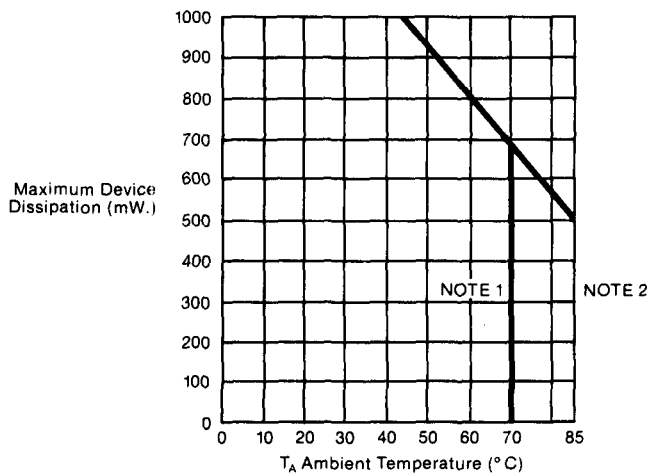

POWER SUPPLY CURRENT VS TEMPERATURE (TYPICAL LIMITS)

MICROCOMPUTER

POWER DISSIPATION DERATING GRAPH

NOTES:

1. 70°C is the maximum operating temperature for standard parts.
2. 85°C is the maximum operating temperature for "I" suffix parts.

PIC1655A EMULATION CAUTIONS

When emulating a PIC1655A using a PICES II development system certain precautions should be taken.

A. Be sure that the PICES II Module being used is programmed for the PIC1650A mode. (Refer to the PICES Manual). The PIC1664 contained within the module should have the MODE pin #22 set to a high state.

1. This causes the $\overline{\text{MCLR}}$ to force all I/O registers high.
2. The OSC 1 pin #59 becomes a single clock input pin.
3. The interrupt system becomes disabled and the RTCC always counts on the trailing edges.
4. Bits 3 through 7 on file register F3 are all ones.

B. Make sure to only use two levels of stack within the program.

C. Make sure all I/O cautions contained in this spec sheet are used.

D. Be sure to use the 28 pin socket for the module plug.

E. Make sure that during an actual application the MCLR input swings from a low to high level a minimum of 1msec after the supply voltage is applied.

F. If an oscillator drive is used, be sure that it can drive the 120Ω input impedance of the OSC pin on the PIC1664.

G. The cable length and internal variations may cause some parameter values to differ between the PICES II module and a production PIC1655A.
