55.15 Revision History ........................................................... 55-13
55.1 INTRODUCTION

The Data Signal Modulator (DSM) is a peripheral which allows the user to mix a data stream (the "Modulator signal") with a carrier signal to produce a modulated output.

Both the carrier and the Modulator signals are supplied to the DSM module, either internally from the output of a peripheral, or externally through an input pin.

The modulated output signal is generated by performing a logical "AND" operation of both the carrier and Modulator signals and then it is provided to the MDOUT pin.

The carrier signal is comprised of two distinct and separate signals: a Carrier High (CARH) signal and a Carrier Low (CARL) signal. During the time in which the Modulator (MOD) signal is in a logic high state, the DSM mixes the Carrier High signal with the Modulator signal. When the Modulator signal is in a logic low state, the DSM mixes the Carrier Low signal with the Modulator signal.

Using this method, the DSM can generate the following types of key modulation schemes:

- Frequency Shift Keying (FSK)
- Phase-Shift Keying (PSK)
- On-Off Keying (OOK)

Additionally, the following features are provided within the DSM module:

- Carrier Synchronization
- Carrier Source Polarity Select
- Carrier Source Pin Disable
- Programmable Modulator Data
- Modulator Source Pin Disable
- Modulated Output Polarity Select
- Slew Rate Control

Figure 55-1 shows a simplified block diagram of the Data Signal Modulator peripheral.
Figure 55-1: Simplified Block Diagram of the Data Signal Modulator
55.2 DSM OPERATION

The DSM module can be enabled by setting the MDEN bit in the MDCON register. Clearing the MDEN bit in the MDCON register disables the DSM module by automatically switching the Carrier High and Carrier Low signals to the Vss signal source. The Modulator signal source is also switched to the MDBIT in the MDCON register. This not only assures that the DSM module is inactive, but that it is also consuming the least amount of current.

The values used to select the Carrier High, Carrier Low and Modulator sources, held by the Modulation Source, Modulation High Carrier and Modulation Low Carrier Control registers, are not affected when the MDEN bit is cleared, and the DSM module is disabled. The values inside these registers remain unchanged while the DSM is inactive. The sources for the Carrier High, Carrier Low and Modulator signals will once again be selected when the MDEN bit is set and the DSM module is again enabled and active.

The modulated output signal can be disabled without shutting down the DSM module. The DSM module will remain active and continue to mix signals, but the output value will not be sent to the MDOUT pin. During the time that the output is disabled, the MDOUT pin will remain low. The modulated output can be disabled by clearing the MDOE bit in the MDCON register.

55.3 MODULATOR SIGNAL SOURCES

The Modulator signal can be supplied from the following sources:
- OC/PWM<1:7>
- SDO1 and SDO2
- UART<1:4> TX Signal
- External Signal on MDMIN Pin
- MDBIT bit in the MDCON Register

The Modulator signal is selected by configuring the MS<3:0> bits in the MDSRC register.

55.4 CARRIER SIGNAL SOURCES

The Carrier High signal and Carrier Low signal can be supplied from the following sources:
- OC/PWM<1:7>
- Reference Clock Module Signal (REFO)
- External Signal on MDCIN1 Pin (MDCIN1) and MDCIN2 Pin (MDCIN2)
- Vss

The Carrier High signal is selected by configuring the CH<3:0> bits in the MDCAR register. The Carrier Low signal is selected by configuring the CL<3:0> bits in the MDCAR register.
55.5 CARRIER SYNCHRONIZATION

During the time when the DSM switches between Carrier High and Carrier Low signal sources, the carrier data in the modulated output signal can become truncated. To prevent this, the carrier signal can be synchronized to the Modulator signal. When synchronization is enabled, the carrier pulse that is being mixed at the time of the transition is allowed to transition low before the DSM switches over to the next carrier source.

Synchronization is enabled separately for the Carrier High and Carrier Low signal sources. Synchronization for the Carrier High signal can be enabled by setting the CHSYNC bit and the synchronization for the Carrier Low signal can be enabled by setting the CLSYNC bit in the MDCAR register.

Figure 55-2 through Figure 55-6 show timing diagrams of using various synchronization methods.

**Figure 55-2: On-Off Keying (OOK) Synchronization**

Figure 55-6: Full Synchronization (CHSYNC = 1, CLSYNC = 1)
55.6 CARRIER SOURCE POLARITY SELECT
The signal provided from any selected input source for the Carrier High and Carrier Low signals can be inverted. Inverting the signal for the Carrier High source is enabled by setting the CHPOL bit of the MDCAR register. Inverting the signal for the Carrier Low source is enabled by setting the CLPOL bit of the MDCAR register.

55.7 CARRIER SOURCE PIN DISABLE
Some peripherals assert control over their corresponding output pin when they are enabled. For example, when the OC/PWM module is enabled, the output of OC/PWM is connected to the OC/PWM pin.
This default connection to a pin can be disabled by setting the CHODIS bit in the MDCAR register for the Carrier High source, and the CLODIS bit in the MDCAR register for the Carrier Low source.

55.8 PROGRAMMABLE MODULATOR DATA
The MDBIT of the MDCON register can be selected as the source for the Modulator signal. This gives the user the ability to program the value used for modulation.

55.9 MODULATOR SOURCE PIN DISABLE
The Modulator source default connection to a pin can be disabled by setting the SODIS bit in the MDSRC register.

55.10 MODULATED OUTPUT POLARITY
The modulated output signal, provided on the MDOUT pin, can also be inverted. Inverting the modulated output signal is enabled by setting the MDOPOL bit of the MDCON register.

55.11 SLEW RATE CONTROL
When modulated data streams of 20 MHz or greater are required, the slew rate limitation on the output port pin can be disabled. The slew rate limitation can be removed by clearing the MDSLR bit in the MDCON register.

55.12 OPERATION IN SLEEP MODE
The DSM module is not affected by Sleep mode. The DSM can still operate during Sleep if the Carrier and Modulator input sources are also still operable during Sleep.

55.13 EFFECTS OF A RESET
Upon any device Reset, the Data Signal Modulator module is disabled. The user’s firmware is responsible for initializing the module before enabling the output. The registers are reset to their default values.

bit 15

Legend:

R = Readable bit  W = Writable bit  U = Unimplemented bit, read as ‘0’

-n = Value at POR  ‘1’ = Bit is set  ‘0’ = Bit is cleared  x = Bit is unknown

bit 15  MDEN: Modulator Module Enable bit
1 = Modulator module is enabled and mixing input signals
0 = Modulator module is disabled and has no output

bit 14  MDFRZ: MOD Freeze in Debug Mode bit
1 = When the emulator is in Debug mode, the module freezes operation
0 = When the emulator is in Debug mode, the module continues operation

bit 13  MSIDL: Modulator Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12-7  Unimplemented: Read as ‘0’

bit 6  MDOE: Modulator Module Pin Output Enable bit
1 = Modulator pin output is enabled
0 = Modulator pin output is disabled

bit 5  MDSL: MDOUT Pin Slew Rate Limiting bit
1 = MDOUT pin slew rate limiting is enabled
0 = MDOUT pin slew rate limiting is disabled

bit 4  MDOPOL: Modulator Output Polarity Select bit
1 = Modulator output signal is inverted
0 = Modulator output signal is not inverted

bit 3  MDOUT: Modulator Output bit
Displays the current output value of the Modulator module.(1)

bit 2-1  Unimplemented: Read as ‘0’

bit 0  MDBIT: Manual Modulation Input bit(2)
1 = Carrier is modulated
0 = Carrier is not modulated

Note 1: The modulated output frequency can be greater and asynchronous from the clock that updates this register bit. The bit value may not be valid for higher speed Modulator or carrier signals.

2: The MDBIT must be selected as the modulation source (MDSRC<3:0> = 0000).

**Note 1:** Narrowed carrier pulse widths or spurs may occur in the signal stream if the carrier is not synchronized.
Example 55-1: Data Signal Modulation with Software Controlled Bit

```c
#include "p24Fxxxx.h"

main()
{
    MDCAR=0x00;
    MDCON =0x00;
    MDSRC=0x00;
    MDCONbits.MDEN=1;  //enable the data signal modulator module
    MDSRCbits.MDSRC=1; //selecting modulating source as the MDBIT
    //allows software to manually control the modulation
    MDCARbit.CH=3;     //select the carrier high signal as reference clock
    MDCARbits.CL=0;    //select the carrier low signal as Vss
    MDCONbits.MDOE=1;  //enable the output of the modulator

    while(1) //infinite loop where the carrier signal is modulated
             //with the manual software control of the MDBIT
    {
        for(i=0;i<30;i++)
            Nop();
        MDCONbits.MDBIT=1;
        Nop();
        for(i=0;i<30;i++)
            Nop();
        MDCONbits.MDBIT=0;
        Nop();
    }
}
```
55.14 RELATED APPLICATION NOTES

This section lists application notes that are related to this section of the manual. These application notes may not be written specifically for the PIC24F device family, but the concepts are pertinent and could be used with modification and possible limitations. The current application notes related to the DSM module are:

**Note:** Please visit the Microchip web site (www.microchip.com) for additional application notes and code examples for the PIC24F family of devices.
55.15 REVISION HISTORY

Revision A (May 2011)
This is the initial released revision of this document.
NOTES:
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, KEELOG, KEELOG logo, MPLAB, PIC, PICmicro, PICSTART, PIC\textsuperscript{32} logo, rPIC and Uni/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC\textsuperscript{©} MCUs and dsPIC\textsuperscript{©} DSCs, KezLoc\textsuperscript{©} code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
