52.15 Revision History .................................................................................................... 52-29
52.1  INTRODUCTION

The dsPIC33F/PIC24H oscillator system includes these characteristics:

- Four external and internal oscillator options
- On-chip Phase-Locked Loop (PLL) to boost the internal operating frequency on selected internal and external oscillator sources
- On-the-fly clock switching between various clock sources
- Doze mode for system power-saving
- Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown
- Nonvolatile Configuration bits for clock source selection

A block diagram of the dsPIC33F/PIC24H oscillator system is shown in Figure 52-1.

**Figure 52-1: Oscillator System Block Diagram**

**Note**

1. See Figure 52-8 for PLL details.
2. If the Primary Oscillator is used with XT or HS modes, an external parallel resistor with the value of 1 MΩ must be connected.
52.2 CPU CLOCKING

The system clock (Fosc) source can be provided by one of the following options:

- Primary Oscillator (Posc) on the OSC1 and OSC2 pins
- Secondary Oscillator (Sosc) on the SOSCI and SOSCO pins
- Internal Fast RC (FRC) Oscillator with optional clock divider
- Internal Low-Power RC (LPRC) Oscillator
- Posc with PLL
- Internal FRC Oscillator with PLL

The Fosc source is divided by 2 to produce the internal instruction cycle clock. In this document, the instruction cycle clock is denoted by FCY. The timing diagram in Figure 52-2 shows the relationship among Fosc, instruction cycle clock (FCY), and the Program Counter (PC).

FCY can be output on the OSC2 I/O pin if the Primary Oscillator mode or the High Speed Oscillator (HS) mode is not selected as the clock source (see Section 52.5 “Primary Oscillator (Posc)”).

Figure 52-2: Clock and Instruction Cycle Timing
52.3 OSCILLATOR CONFIGURATION REGISTERS

Oscillator Configuration registers are located in the program memory space, and are not Special Function Registers (SFRs). These two registers are mapped into program memory space and are programmed at the time of device programming.

- **FOSCSEL: Oscillator Source Selection Register**
  
  FOSCSEL selects the initial oscillator source and start-up option. FOSCSEL contains the following Configuration bit:
  
  FNOSC<2:0> Configuration bits in the Oscillator Source Selection (FOSCSEL<2:0>) register determine the clock source that is used at a Power-on Reset (POR). Thereafter, the clock source can be changed between permissible clock sources with clock switching.
  
  The Internal FRC Oscillator with postscaler (FRCDIVN) is the default (unprogrammed) selection.

- **FOSC: Oscillator Configuration Register**
  
  FOSC configures the Primary Oscillator mode, OSCO pin function, peripheral pin select, and the fail-safe and clock switching modes. FOSC contains the following Configuration bits:
  
  - POSCMD (FOSC<1:0>) Configuration bits select the operation mode of the POSC.
  - OSCIOFNC (FOSC<2>) Configuration bit selects the OSC2 pin function, except in HS mode or Medium Speed Oscillator (XT) mode.

  If OSCIOFNC is unprogrammed (‘1’), the FCY clock is output on the OSC2 pin.
  
  If OSCIOFNC is programmed (‘0’), the OSC2 pin becomes a general purpose I/O pin.

Table 52-1 lists the configuration settings that select the device oscillator source and operating mode at a POR.

R = Readable bit  P = Programmable bit  U = Unused bits, program to Logic ‘1’
-n = Value at POR  ‘1’ = Bit is set  ‘0’ = Bit is cleared  x = Bit is unknown

bit 15-8  **Unimplemented**: Read as ‘1’
bit 7-6  **FCKSM<1:0>**: Clock Switching Mode bits
  1x = Clock switching is disabled, Fail-Safe Clock Monitor (FSCM) is disabled
  01 = Clock switching is enabled, FSCM is disabled
  00 = Clock switching is enabled, FSCM is enabled
bit 5  **IOL1WAY**: Peripheral Pin Select Configuration bit(1)
  1 = Allow only one reconfiguration
  0 = Allow multiple reconfigurations
bit 4-3  **Unimplemented**: Read as ‘1’
bit 2  **OSCIOFNC**: OSC2 Pin Function bit (except in XT and HS modes)
  1 = OSC2 is the clock output and the instruction cycle (FCY) clock is output on OSC2 pin
  0 = OSC2 is a general purpose digital I/O pin
bit 1-0  **POSCMD<1:0>**: Primary Oscillator Mode Selection bits
  11 = Primary Oscillator is disabled
  10 = HS Crystal Oscillator mode
  01 = XT Crystal Oscillator mode
  00 = EC (External Clock) mode

**Note 1:** This bit is not available on all dsPIC33F/PIC24H devices. Refer to the specific device data sheet for more information.
52.4 SPECIAL FUNCTION REGISTERS

The following SFRs provide run-time control and the status of the oscillator system:

- **OSCCON: Oscillator Control Register**
  
  OSCCON controls clock switching and provides status information that allows current clock source, PLL lock, and clock fail conditions to be monitored.

- **CLKDIV: Clock Divisor Register**
  
  CLKDIV controls Doze mode and selects a PLL prescaler, a PLL postscaler, and an FRC postscaler.

- **OSCTUN: FRC Oscillator Tuning Register**
  
  OSCTUN is used to tune the Internal FRC Oscillator frequency in software. It allows the Internal FRC Oscillator frequency to be adjusted over a range of ±12%.

**Note:** The oscillator SFRs (OSCCON, CLKDIV, and OSCTUN) are reset only on a POR.

  - 010 = Primary Oscillator (XT, HS, EC)
  - 001 = Fast RC Oscillator with PLL (FRCPLL)
  - 000 = Fast RC Oscillator (FRC)
- bit 7 **CLKLOCK**: Clock Lock Enable bit
  - If clock switching is enabled and FSCM is disabled, FCKSM<1:0> (FOSC<7:6>) = 01:
    - 1 = Clock switching is disabled, system clock source is locked
    - 0 = Clock switching is enabled, system clock source may be modified by clock switching
- bit 6 **IOLOCK**: Peripheral Pin Select (PPS) Lock bit\(^{(1)}\)
  - 1 = Peripheral Pin Select is locked. Writes to Peripheral Pin Select registers are not allowed.
  - 0 = Peripheral Pin Select is not locked. Writes to Peripheral Pin Select registers are allowed.
- bit 5 **LOCK**: PLL Lock Status bit (read-only)
  - 1 = Indicates that PLL is in lock, or PLL start-up timer is satisfied
  - 0 = Indicates that PLL is out of lock, start-up timer is in progress or PLL is disabled
- bit 4 **Unimplemented**: Read as ‘0’
- bit 3 **CF**: Clock Fail Detect bit (read or cleared by application)
  - 1 = FSCM has detected clock failure
  - 0 = FSCM has not detected clock failure

Note 1: This bit is not available on all dsPIC33F/PIC24H devices. Refer to the specific device data sheet for more information.

2: Writes to this register require an unlock sequence. For details and examples refer to [52.11 “Clock Switching”](#).

Preliminary
52.5 PRIMARY OSCILLATOR (Posc)

The Posc is available on the OSC1 and OSC2 pins of the dsPIC33F/PIC24H device family. This connection enables an external crystal (or ceramic resonator) to provide the clock to the device. Optionally, it can be used with the internal PLL to boost the Fosc to 80 MHz for 40 MIPS execution. The Posc provides the following modes of operation:

- **Medium-Speed Oscillator (XT Mode)**
  
  XT mode is a medium-gain, medium-frequency mode that is used to work with crystal frequencies of 3-10 MHz.

- **High-Speed Oscillator (HS Mode)**
  
  HS mode is a high-gain, high-frequency mode that is used to work with crystal frequencies of 10-40 MHz.

- **External Clock Source Operation (EC Mode)**
  
  If the on-chip oscillator is not used, EC mode allows the internal oscillator to be bypassed. The device clocks are generated from an external source (0.8-64 MHz) and input on the OSC1 pin.

The FNOSC<2:0> Configuration bits in the Oscillator Source Selection register (FOSCSEL<2:0>) specify the Posc clock source at a POR. The POSCM<1:0> Configuration bits in the Oscillator Configuration register (FOSC<1:0>) specify the Primary Oscillator mode. Table 52-2 shows the options selected by specific bit configurations, which are programmed at the time of device programming.

A diagram of the crystal oscillator circuit that is recommended for the dsPIC33F/PIC24H device is presented in Figure 52-1.

**Figure 52-3: Crystal or Ceramic Resonator Operation in XT or HS Oscillator Mode**

Capacitors C1 and C2 form the load capacitance for the crystal.
The optimum load capacitance (CL) for a given crystal is specified by the crystal manufacturer. CL can be calculated as shown in Equation 52-1.

**Equation 52-1: Crystal Load Capacitance**

\[
CL = CS + \frac{C1 \times C2}{C1 + C2}
\]

Where:

- \(CS\) is the stray capacitance.

Assuming \(C1 = C2\), Equation 52-2 gives the capacitor value (C1, C2) for a given load and stray capacitance.

**Equation 52-2: External Capacitor for Crystal**

\[
C1 = C2 = 2 \times (CL - CS)
\]

For additional information on crystal oscillators and their operation, refer to 52.14 “Related Application Notes”.

### 52.5.1 Oscillator Start-up Time

As the device voltage increases from \(V_{SS}\), the oscillator will start its oscillations. The time required for the oscillator to start oscillating depends on many factors. These factors could include:

- Crystal and resonator frequency
- Capacitor values used
- Device \(V_{DD}\) rise time
- System temperature
- Series resistor value and type, if used
- Oscillator mode selection of device (selects the gain of the internal oscillator inverter)
- Crystal quality
- Oscillator circuit layout
- System noise

Figure 52-4 shows a plot of a typical oscillator and resonator start-up.

**Figure 52-4: Example Oscillator and Resonator Start-up Characteristics**

To ensure that a crystal oscillator (or ceramic resonator) has started and stabilized, an Oscillator Start-up Timer (OST) is provided with the \(POsc\) and \(SOsc\). The OST is a simple 10-bit counter that counts 1024 cycles before releasing the oscillator clock to the rest of the system. This time-out period is denoted as \(TOST\).
The amplitude of the oscillator signal must reach the \( V_{IL} \) and \( V_{IH} \) thresholds for the oscillator pins before the OST can begin to count cycles. The \( T_{OST} \) interval is required every time the oscillator restarts (e.g., on a POR, BOR and wake-up from Sleep mode).

When the \( P_{OSC} \) is enabled, it takes a finite amount of time to start oscillating. This delay is denoted as \( T_{OSCD} \). After \( T_{OSCD} \), the OST timer takes 1024 clock cycles (\( T_{OST} \)) to release the clock. The total delay for the clock to be ready is \( T_{OSCD} + T_{OST} \). If the PLL is used, an additional delay is required for the PLL to lock, see 52.7 “Phase-Locked Loop”.

\( P_{OSC} \) start-up behavior is illustrated in Figure 52-5, indicating where the CPU begins toggling an I/O pin when it starts execution after the \( T_{OSCD} + T_{OST} \) interval.

Figure 52-5: Oscillator Start-up Characteristics

52.5.2 \( P_{OSC} \) Pin Functionality

The \( P_{OSC} \) pins (OSC1 and OSC2) can be used for other functions when the oscillator is not being used. \( P_{OSCMD}\langle 1:0 \rangle \) Configuration bits in the Oscillator Configuration register (FOSC<1:0>) determine the oscillator pin function. The \( OSCIOFNC \) bit (FOSC<2>) determines the OSC2 pin function.

\( P_{OSCMD} \): Primary Oscillator Mode Selection bits:
- 11 = Primary Oscillator mode disabled
- 10 = HS Oscillator mode selected
- 01 = XT Oscillator mode selected
- 00 = External Clock mode selected

\( OSCIOFNC \): OSC2 Pin Function bit (except in XT and HS modes):
- 1 = OSC2 is the clock output and the instruction cycle (FCY) clock is output on the OCS2 pin, see Figure 52-6
- 0 = OSC2 is a general purpose digital I/O pin, see Figure 52-7
The oscillator pin functions are provided in Table 52-3.

52.6 INTERNAL FAST RC (FRC) OSCILLATOR

The Internal FRC Oscillator provides a nominal 7.37 MHz clock without requiring an external crystal or ceramic resonator, which results in system cost savings for applications that do not require a precise clock reference.

The application software can tune the frequency of the oscillator from -12% to +11.625% (30 kHz steps) of the nominal frequency value using the FRC Oscillator Tuning bits (TUN<5:0>) in the FRC Oscillator Tuning register (OSCTUN<5:0>).

The Internal FRC Oscillator starts up instantly. Unlike a crystal oscillator, which can take several milliseconds to begin oscillation, the Internal FRC Oscillator starts oscillating immediately.

The Initial Oscillator Source Selection Configuration bits (FNOSC<2:0>) in the Oscillator Source Selection register (FOSCSEL<2:0>) select the FRC clock source. The FRC clock source options at the time of a POR are shown in Table 52-4. The Configuration bits are programmed at the time of device programming.

### Table 52-4: FRC Clock Source Options at POR

</table>

52.6.1 FRC Postscaler Mode (FRCDIVN)

In FRC Postscaler mode, a variable postscaler divides the FRC clock output and allows a lower frequency to be chosen. The postscaler is controlled by the Internal FRC Oscillator Postscaler bits (FRCDIV<2:0>) in the Clock Divisor register (CLKDIV<10:8>), which allow eight settings, from 1:1-1:256, to be chosen, as shown in Table 52-5.

</table>

Note 1: Refer to the specific device data sheet for the accuracy of the FRC clock frequency over temperature and voltage variations.

2: The FRC Oscillator Tuning bits (TUN<5:0>) should not be changed dynamically when operating in internal FRC with PLL.

To change the FRC Oscillator Tuning bits:
- a) Switch the clock to non-PLL mode (e.g., Internal FRC).
- b) Make the necessary changes.
- c) Switch the clock back to PLL mode.
52.7 PHASE-LOCKED LOOP

There are several different versions of the PLL block implemented on dsPIC33F/PIC24H devices. The version implemented depends on the particular device family. Some PLL blocks provide a single branch, frequency multiplied output. Others provide multiple branches with clocks at different frequencies, including a special clock for a particular peripheral. Users should refer to the specific device data sheet to determine which PLL block is implemented.

The POSC and Internal FRC Oscillator sources can optionally use an on-chip PLL to obtain higher operating speeds. Figure 52-8 shows a block diagram of the PLL module.

Figure 52-8: dsPIC33F/PIC24H PLL Block Diagram

For a proper PLL operation, the FIN input frequency and FOSC output frequency must meet the following requirements:

- The input frequency (FIN) must be in the range of 3.0-8.0 MHz
- The output frequency (FOSC) must be lower than 32 MHz

Equation 52-3 shows the relation between FCY, FIN, and FOSC.

Equation 52-3: Fosc Calculation

\[
F_{CY} = \frac{F_{OSC}}{2} = \frac{(F_{IN} \cdot 4)}{2}
\]

52.7.1 PLL Lock Status

Whenever a clock source with PLL is selected, the PLL requires a finite amount of time (TLOCK) to synchronize to the new settings.

TLOCK is applied when the PLL is selected as the clock source at a POR, or during a clock switching operation. The value of TLOCK is relative to the time at which the clock is available to the PLL input. For example, with the POSC, TLOCK starts after the OST delay. Refer to 52.5.1 “Oscillator Start-up Time” for more information about oscillator start-up delay. Refer to the specific device data sheet for information about typical TLOCK values.

The LOCK bit in the Oscillator Control register (OSCCON<5>) is a read-only Status bit that indicates the lock status of the PLL. The LOCK bit is cleared at a POR and on a clock switch operation, if the PLL is selected as the destination clock source. The LOCK bit remains clear when any clock source that is not using a PLL is selected. After a clock switch event in which a PLL is enabled, it is a good practice to wait for the LOCK bit to be set before executing other code.

52.7.1.1 SETUP FOR USING THE PLL WITH THE POSC

The following process is used to set up the PLL to operate the device at 16 MIPS with a 8 MHz external crystal:

1. To execute instructions at 16 MHz, ensure that the required system clock frequency is:

   \[ F_{OSC} = 2 \times F_{CY} = 32 \text{ MHz} \]

2. Configure the FNOSC<2:0> bits (FOSCSEL<2:0>) to use the POSC with PLL at a POR.
Example 52-1 illustrates code for using the PLL with the P0sc. (See also Section 52.11 “Clock Switching” for clock switching example code.)

Example 52-1: Code Example for Using the PLL with the P0sc

```c
// Select Internal FRC at POR
_FOSCSEL(FNOSC_FRC);

// Enable Clock Switching and Configure P0sc in XT mode
_FOSC(FCKSM_CSECMD & OSCIOFNC_OFF & POSCMD_XT);

int main()
{
    // Initiate Clock Switch to Primary Oscillator with PLL (NOSC = 0b011)
    __builtin_write_OSCCONH(0x03);
    __builtin_write_OSCCONL(0x01);

    // Wait for Clock switch to occur
    while (OSCCONbits.COSC! = 0b011);

    // Wait for PLL to lock
    while(OSCCONbits.LOCK! = 1) {};
}
```

52.7.1.2 SETUP FOR USING THE PLL WITH 7.37 MHz INTERNAL FRC

The following process is used to set up the PLL to operate the device at 16 MIPS with a 7.37 MHz Internal FRC.

1. To execute instruction at 16 MHz, ensure that the system clock frequency is:
   \[ F_{osc} = 2 \times F_{cy} = 32 \text{ MHz} \]
2. Configure the FNOSC<2:0> bits (FOSCSEL<2:0>) to use FRC at a POR.
3. Configure the FRC to approximately 8 MHz by setting OSCTUN = 0x0017.
4. Perform a clock switch to FRC with PLL.

Example 52-2 illustrates code for using the PLL with a 7.37 MHz Internal FRC to operate the device at 16 MIPS. (See also 52.11 “Clock Switching” for clock switching example code.)

Example 52-2: Code Example for Using the PLL with 7.37 MHz Internal FRC

```c
// Select Internal FRC at POR
_FOSCSEL(FNOSC_FRC);

// Enable Clock Switching and Configure P0sc in XT mode
_FOSC(FCKSM_CSECMD & OSCIOFNC_OFF & POSCMD_XT);

int main()
{
    // Set FRC to approximately 8 MHz
    OSCTUN = 0x0017;

    // Initiate Clock Switch to Internal FRC with PLL (NOSC = 0b001)
    __builtin_write_OSCCONH(0x01);
    __builtin_write_OSCCONL(0x01);

    // Wait for Clock switch to occur
    while (OSCCONbits.COSC! = 0b001);

    // Wait for PLL to lock
    while(OSCCONbits.LOCK! = 1) {};
}
```
52.8 SECONARY OSCILLATOR (Sosc)

The Secondary Oscillator (Sosc) enables a 32.768 kHz crystal oscillator to be attached to the dsPIC33F/PIC24H device as a secondary crystal clock source for low-power operation. It uses the SOSC1 and SOSCO pins. The Sosc can also drive Timer1 for Real-Time Clock (RTC) applications.

52.8.1 Secondary Oscillator for System Clock

The Sosc is enabled as the system clock when:

- Initial Oscillator Source Selection Configuration bits (FNOSC<2:0>) in the Oscillator Source Selection register (FOSCSEL<2:0>) are appropriately set to select the Sosc at a POR
- User application initiates a clock switch to the Sosc for low-power operation

When the Sosc is not being used to provide the system clock or the device enters Sleep mode, the Sosc is disabled to save power.

52.8.2 Secondary Oscillator Start-up Delay

When the Sosc is enabled, it takes a finite amount of time to start oscillating. Refer to 52.5.1 “Oscillator Start-up Time” for details.

52.8.3 Continuous Secondary Oscillator Operation

Optionally, you can leave the Sosc running continuously. The Sosc is always enabled if the Secondary Oscillator Enable bit (LPOSCEN) is set in the Oscillator Control register (OSCCON<1>).

There are two reasons to leave the Sosc running.

- First, keeping the Sosc always on allows a fast switch to the 32 kHz system clock for lower-power operation, since returning to the faster main oscillator still requires an oscillator start-up time if it is a crystal type source (see 52.5.1 “Oscillator Start-up Time”).
- Second, the oscillator should remain on continuously when Timer1 is used as an RTC.

Note: In Sleep mode, all clock sources (the Posc, Internal FRC Oscillator, and LPRC Oscillator) are shut down, with the exception of the Sosc. The Sosc can be active in Sleep mode if the Secondary Oscillator Enable bit (LPOSCEN) is set in the Oscillator Control register (OSCCON<1>).
52.9 LOW-POWER RC (LPRC) OSCILLATOR

The Low-Power RC (LPRC) Oscillator provides a nominal clock frequency of 32 kHz. The LPRC Oscillator is the clock source for the Power-up Timer (PWRT), Watchdog Timer (WDT), and Fail-Safe Clock Monitor (FSCM) circuits. It can also be used to provide a low-frequency clock source option for the device in those applications where power consumption is critical and timing accuracy is not required.

Note: The clock frequency of the LPRC Oscillator will vary, depending on the device voltage and operating temperature. Refer to the “Electrical Characteristics” section in the specific device data sheet for details.

52.9.1 LPRC Oscillator for System Clock

The LPRC Oscillator is selected as the system clock in the following conditions:

- the Initial Oscillator Source Selection bits (FNOSC<2:0>) in the Oscillator Source Selection register (FOSCSEL<2:0>) are appropriately set to select LPRC Oscillator at a POR
- the user software initiates a clock switch to the LPRC Oscillator for low-power operation

52.9.2 Enabling the LPRC Oscillator

The LPRC Oscillator is the clock source for the PWRT, WDT, and FSCM. The LPRC Oscillator is enabled at a POR when the Power-on Reset Timer Value Select bits (FPWRT) in the POR Configuration Fuse register (FPOR<2:0>) are set.

The LPRC Oscillator remains enabled in the following conditions:

- the FSCM is enabled
- the WDT is enabled
- the LPRC Oscillator is selected as the system clock

If none of these conditions is true, the LPRC Oscillator shuts off after the PWRT expires. The LPRC Oscillator is shut off in Sleep mode.

Note: The LPRC runs in Sleep mode only if WDT is enabled. Under all other conditions, the LPRC is disabled in Sleep mode.

52.9.3 LPRC Oscillator Start-up Delay

The LPRC Oscillator starts up instantly; unlike a crystal oscillator, which can take several milliseconds to begin oscillation.
52.10  FAIL-SAFE CLOCK MONITOR (FSCM)

The Fail-Safe Clock Monitor (FSCM) allows the device to continue to operate when an oscillator failure occurs. FSCM function is enabled by programming the Clock Switching Mode Configuration bits (FCKSM<1:0>) in the Oscillator Configuration register (FOSC<7:6>) during device programming. When the FSCM is enabled (FCKSM<1:0> = 00), the LPRC Oscillator runs continuously – except during Sleep state.

The FSCM monitors the system clock. If it does not detect a system clock within a specific period of time (2 ms typically, 4 ms maximum), the FSCM generates a clock failure trap and switches the system clock to the Internal FRC Oscillator. At that point, the user application can either attempt to restart the oscillator or execute a controlled shutdown.

The FSCM module takes the following actions when it switches to the Internal FRC Oscillator:

- Current Oscillator Selection bits COSC<2:0> (OSCCON<14:12>) are loaded with '000' (Internal FRC Oscillator)
- Clock Fail Detect bit CF (OSCCON<3>) is set to indicate the clock failure
- Oscillator Switch Enable Control bit OSWEN (OSCCON<0>) is cleared to cancel any pending clock switches

52.10.1  FSCM Delay

The FSCM monitors the system clock for activity after the system clock is ready and the nominal delay (TFSCM) has elapsed.

The FSCM delay is applied when the FSCM is enabled, and the POSC or SOSC is selected as the system clock.

Note: Refer to the “Electrical Characteristics” section of the specific device data sheet for TFSCM values.

For additional information, refer to Section 8. “Reset” (DS70192). The most recent documentation can always be found on the Microchip web site, www.microchip.com.

52.10.2  FSCM and WDT

The FSCM and WDT use the LPRC Oscillator as their time base. In the event of a clock failure, the WDT is unaffected and continues to run on the LPRC Oscillator.
52.11 CLOCK SWITCHING

Clock switching can be initiated as a result of a hardware event or a software request. Typical scenarios include:

- Two-speed start-up sequence on a POR, which initially uses the Internal FRC Oscillator for quick start-up, and then automatically switches to the selected clock source when the clock is ready.
- FSCM automatically switches to the Internal FRC Oscillator on a clock failure.
- User application software requests clock switching by setting the OSWEN bit (OSCCON<0>), causing the hardware to switch to the clock source selected by the NOSC<2:0> bits (OSCCON<10:8>) when the clock is ready.

In each of these cases, the clock switch event assures that the proper make-before-break sequence is executed. That is, the new clock source must be ready before the old clock is deactivated, and code must continue to execute as clock switching occurs.

Some dsPIC33F/PIC24H devices feature the Phase-Locked Loop Enable bit (PLLKEN) in the FWDT Fuse Configuration register (FWDT<5>). Setting this bit will cause the device to wait until the PLL locks before switching to the PLL clock source. When this bit is set to '0', the device will not wait for the PLL lock and will proceed with the clock switch. The default setting for this bit is '1'. Refer to Section 25. “Device Configuration” (DS70194) of this Family Reference Manual for more information.

With few limitations, applications are free to switch between any of the 4 clock sources (the POSC, SOSC, FRC, and LPRC) that are under software control at any time. To limit the possible side effects that could result from this flexibility, dsPIC33F/PIC24H devices have a safeguard lock built into the switch process. That is, the OSCCON register is write-protected during clock switching.

52.11.1 Enabling Clock Switching

The Clock Switching Mode Configuration bits (FCKSM<1:0>) in the Oscillator Configuration register (FOSC<7:6>) must be programmed to enable clock switching and the FSCM.

Table 52-6: Configurable Clock Switching Modes

<table>
<thead>
<tr>
<th>FCKSM&lt;1:0&gt; Values</th>
<th>Clock Switching Configuration</th>
<th>FSCM Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>1x</td>
<td>Disabled</td>
<td>Disabled</td>
</tr>
<tr>
<td>01</td>
<td>Enabled</td>
<td>Disabled</td>
</tr>
<tr>
<td>00</td>
<td>Enabled</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

The first bit determines if clock switching is enabled (‘0’) or disabled (‘1’). The second bit determines if the FSCM is enabled (‘0’) or disabled (‘1’). The FSCM can only be enabled if clock switching is also enabled. If clock switching is disabled (‘1’), the value of the second bit is irrelevant.

52.11.2 Clock Switch Sequence

The recommended process for a clock switch is as follows:

1. Read the COSC<2:0> bits (OSCCON<14:12>) to determine the current oscillator source (if this information is relevant to the application).
2. Execute the unlock sequence, allowing a write to the high byte of the OSCCON register.
3. Write the appropriate value to the NOSC<2:0> Control bits (OSCCON<10:8>) for the new oscillator source.
4. Execute the unlock sequence, allowing a write to the low byte of the OSCCON register.
5. Set the OSWEN bit (OSCCON<0>) to initiate the oscillator switch.
After the previous steps are completed, the clock switch logic performs the following steps:

1. The clock switching hardware compares the COSC<2:0> Status bits (OSCCON<14:12>) with the new value of the NOSC<2:0> Control bits (OSCCON<10:8>). If they are the same, the clock switch is a redundant operation. In this case, the OSWEN bit (OSCCON<0>) is cleared automatically and the clock switch is aborted.

2. If a valid clock switch has been initiated, the PLL Lock Status bits (OSCCON<5>) and Clock Fail Status bits (OSCCON<3>) are cleared.

3. The new oscillator is turned on by the hardware (if it is not currently running). If a crystal oscillator (the POSC or SOSC) must be turned on, the hardware waits for TOSCD until the crystal starts oscillating and TOST expires. If the new source uses the PLL, the hardware waits until a PLL lock is detected (OSCCON<5> = 1).

4. The hardware waits for the new clock source to stabilize and then performs the clock switch.

5. The hardware clears the OSWEN bit (OSCCON<0>) to indicate a successful clock transition. In addition, the NOSC<2:0> bit values (OSCCON<10:8>) are transferred to the COSC<2:0> Status bits (OSCCON<14:12>).

6. The old clock source is turned off at this time, with the exception of the LPRC (if the WDT or FSCM is enabled) or the Sosc (if the SOSCEN remains set). The timing of the transition between clock sources is shown in Figure 52-9.

Note 1: Clock switching between the XT, HS and EC Primary Oscillator modes is not possible without reprogramming the device.

2: Direct clock switching between the PLL modes is not possible. For example, clock switching should not occur between the POSc with PLL and the Internal FRC Oscillator with PLL.

3: Setting the CLKLOCK bit (OSCCON<7>) prevents clock switching when clock switching is enabled and the FSCM is disabled by the Configuration bits FCKSM<1:0> (FOSC<7:6>) = 01. The CLKLOCK bit (OSCCON<7>) cannot be cleared when it has been set by software; it clears on a POR.

4: The processor continues to execute code throughout the clock switching sequence. Timing-sensitive code should not be executed during this time.

5: The clock switch will not wait for the PLL lock if the PLLKEN bit in the FWDT Fuse Configuration register (FWDT<5>) is set to ‘0’.

Figure 52-9: Clock Transition Timing Diagram

Note: The system clock can be any selected source – POSc, Sosc, FRC or LPRC.
A recommended code sequence for a clock switch includes the following actions:

1. Disable interrupts during the OSCCON register unlock-and-write sequence.
2. Execute the unlock sequence for the OSCCON high byte. In 2 back-to-back instructions:
   - write 0x78 to OSCCON<15:8>
   - write 0x9A to OSCCON<15:8>
3. In the instruction immediately following the unlock sequence, write the new oscillator source to the NOSC<2:0> Control bits (OSCCON<10:8>.
4. Execute the unlock sequence for the OSCCON low byte. In 2 back-to-back instructions:
   - write 0x46 to OSCCON<7:0>
   - write 0x57 to OSCCON<7:0>
5. In the instruction immediately following the unlock sequence, set the OSWEN bit (OSCCON<0>.
6. Continue to execute code that is not clock-sensitive (optional).
7. Check to see if the OSWEN bit (OSCCON<0>) is ‘0’. If it is, the switch was successful.

**Note:** MPLAB® C Compiler for dsPIC DSCs provides the following built-in C language functions for unlocking the OSCCON register:

```
__builtin_write_OSCCONL(value)
__builtin_write_OSCCONH(value)
```

See MPLAB C Compiler Help for more information.

Example 52-3 illustrates the code sequence for unlocking the OSCCON register and switching from the FRC with PLL clock source to the LPRC clock source.

**Example 52-3: Code Example for Clock Switching**

```
; Place the New Oscillator Selection (NOSC=0b101) in W0
MOV #0x15, WREG

; OSCCONH (high byte) Unlock Sequence
MOV #OSCCONH, w1
MOV #0x78, w2
MOV #0x9A, w3
MOV.B w2, [w1] ; Write 0x78
MOV.B w3, [w1] ; Write 0x9A

; Set New Oscillator Selection
MOV.B WREG, OSCCONH

; Place 0x01 in W0 for setting clock switch enabled bit
MOV #0x01, w0

; OSCCONL (low byte) Unlock Sequence

MOV #0x46, w2
MOV #0x57, w3
MOV.B w2, [w1] ; Write 0x46
MOV.B w3, [w1] ; Write 0x9A

; Enable Clock Switch
MOV.B w0, [w1] ; Request Clock Switching by Setting OSWEN bit

wait:
    btsc OSCCONL, #OSWEN
    bra wait
```
52.11.3 Clock Switching Consideration

When you incorporate clock switching into an application, issues to keep in mind when designing your code include:

- The OSCCON unlock sequence is extremely timing critical. The OSCCON register byte is only writable for 1 instruction cycle following the sequence. Some high-level languages, such as C, may not preserve the timing-sensitive sequence of instructions when compiled. When clock switching is required for an application written in a high-level language, it is best to create the routine in assembler and link it to the application – calling it as a function, when it is required.

- If the destination clock source is a crystal oscillator, the clock switch time will be dominated by the oscillator start-up time.

- If the new clock source does not start, or is not present, clock switching hardware will continue to run from the current clock source. Your software can detect this situation because the OSWEN bit (OSCCON<0>) remains set indefinitely.

- If the new clock source uses a PLL, a clock switch will not occur until lock has been achieved. Your software can detect a loss of a PLL lock because the LOCK bit (OSCCON<5>) is cleared and the OSWEN bit (OSCCON<0>) is set.

- Switching to a low-frequency clock source, such as the secondary oscillator, will result in slow device operation.

52.11.4 Aborting a Clock Switch

If a clock switch does not complete, the clock switch logic can be reset by clearing the OSWEN bit (OSCCON<0>). When OSWEN is cleared, the clock switch process is aborted, OST (if applicable) is stopped and reset, and the PLL (if applicable) is stopped.

Typical assembly code for aborting a clock switch is shown in Example 52-4. A clock switch procedure can be aborted at any time. A clock switch that is already in progress can also be aborted by performing a second clock switch.

Example 52-4: Aborting a Clock Switch

```
MOV #OSCCON,W1 ; pointer to OSCCON
MOV.b #0x46,W2 ; first unlock code
MOV.b #0x57,W3 ; second unlock code
MOV.b W2, [W1] ; write first unlock code
MOV.b W3, [W1] ; write second unlock code
BCLR OSCCON,#OSWEN ; ABORT the switch
```

52.11.5 Entering Sleep Mode During a Clock Switch

If the device enters Sleep mode during a clock switch operation, the clock switch operation is aborted. The processor keeps the old clock selection, and the OSWEN bit is cleared. The PWRSAV instruction is then executed normally.

It is particularly useful to perform a clock switch to the Internal FRC Oscillator before entering Sleep mode, as this will ensure fast wake-up from Sleep.
52.12 TWO-SPEED START-UP

The Internal External Start-up Option Configuration bit (IESO) in the Oscillator Source Selection register (FOSCSEL<7>) specifies whether to start the device with a user-selected oscillator source; or to initially start with the Internal FRC Oscillator, and then automatically switch to the user-selected oscillator. If this bit is set to ‘1’, the device will always power-up on the Internal FRC Oscillator, regardless of the other oscillator source settings (FOSCSEL<2:0>). The device, then, automatically switches to the specified oscillator, when it is ready.

Unless FSCM is enabled, the Internal FRC Oscillator is automatically turned off immediately after the clock switch is completed. The Two-Speed Start-up option is a faster way to get the device up and running, and works independently of the state of the Clock Switching Mode bits (FCKSM<1:0>) in Oscillator Configuration register (FOSC<7:6>.

Two-Speed Start-up is particularly useful when an external oscillator is selected by the FNOSC<2:0> Configuration bits (FOSCSEL<2:0>) and a crystal-based oscillator (either a primary or secondary oscillator) has a longer start-up time. As an internal RC oscillator, the FRC clock source is available almost immediately following a POR. With Two-Speed Start-up, the device starts executing code in its default oscillator configuration – FRC. It continues to operate in this mode until the specified external oscillator source becomes stable, at which time it automatically switches to that source.

User code can check which clock source is currently providing the device clocking by checking the status of the COSC<2:0> bits (OSCCON<14:12>) against the NOSC<2:0> bits (OSCCON<10:8>). If these two sets of bits match, the clock switch has been completed successfully and the device is running from the intended clock source.

**Note:** Two-Speed Start-up is redundant if the selected device clock source is FRC.
## 52.13 REGISTER MAPS

Table 52-7 maps the bit functions for the Oscillator Special Function Control registers. Table 52-8 maps the bit functions for the Oscillator Configuration registers.

### Table 52-7: Oscillator Special Function Control Registers

| File Name | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | All Resets |
|-----------|--------|--------|--------|--------|--------|--------|------|------|------|------|------|------|------|------|------|-------|
| OSCCON    | —      | COSC<2:0> | —      | —      | —      | CLKLOCK| IOLock| LOCK | —    | CF    | —    | LPOSCEN| OSWEN | —    | —    | —    | 7700<sup>(1)</sup> |
| CLKDIV    | ROI    | DOZE<2:0> | DOZEN  | FRCDIV<2:0> | —    | —    | —    | —    | —    | —    | —    | —    | —    | —    | —    | 3000 |
| OSCTUN    | —      | —      | —      | —      | —      | —      | —    | —    | —    | —    | —    | —    | —    | —    | —    | TUN<5:0> |

**Legend:**  
- x = unknown value on Reset, — = unimplemented, read as ‘0’. Reset values are shown in hexadecimal.

**Note 1:** OSCCON register Reset values are dependent on the FOSCSEL Configuration bits and by type of Reset.

**Note 2:** This bit is not available on all dsPIC33F/PIC24H devices. Refer to the specific device data sheet for more information.

### Table 52-8: Oscillator Configuration Registers

| File Name | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | FOSCSEL<2:0> |
|-----------|--------|--------|--------|--------|--------|--------|------|------|------|------|------|------|------|------|------|-------|
| FOSCSEL   | —      | —      | —      | —      | —      | —      | —    | —    | —    | —    | —    | —    | —    | —    | —    | —      | 0000 |

**Legend:**  
- x = unknown value on Reset, — = unimplemented, read as ‘0’. Reset values are shown in hexadecimal.

**Note 1:** This bit is not available on all dsPIC33F/PIC24H devices. Refer to the specific device data sheet for more information.
52.14 RELATED APPLICATION NOTES

This section lists application notes that pertain to this section of the manual. These application notes may not be written specifically for the dsPIC33F/PIC24H Product Family, but the concepts are pertinent and could be used with modification and possible limitations. The current application notes related to the Oscillator module include:

<table>
<thead>
<tr>
<th>Title</th>
<th>Application Note #</th>

<tbody>
<tr>
<td>PIC® Microcontroller Oscillator Design Guide</td>
<td>AN588</td>
</tr>
<tr>
<td>Low-Power Design using PIC® Microcontrollers</td>
<td>AN606</td>
</tr>
<tr>
<td>Crystal Oscillator Basics and Crystal Selection for rfPIC® and PIC® Devices</td>
<td>AN826</td>
</tr>
</tbody>
</table>

**Note:** Please visit the Microchip web site (www.microchip.com) for additional Application Notes and code examples for the dsPIC33F/PIC24H family of devices.
Section 52. Oscillator (Part VI)

52.15 REVISION HISTORY

Revision A (July 2010)
This is the initial release of this document.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, KEELOG, KEELOG logo, MPLAB, PIC, PICmicro, PICSTART, PIC32 logo, rPIC and Uni/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MXDEV, MXLAB, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Hindi, MiWi, MPASM, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Octopus, Omniscient Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICKit, PICtail, REAL ICE, rLAB, Select Mode, Total Endurance, TSHARC, UniWinDriver, WiperLock and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

All other trademarks mentioned herein are property of their respective companies.

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOG code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
