INTRODUCTION

One of the best kept secrets of the PIC32 microcontroller is the availability of an additional 12 Kbytes of Flash memory called the “boot flash”. Traditionally, the boot flash is used to store startup code and the interrupt exception table. And, during the development stage, the debug executive resides there. Through a simple modification to the linker script, you can place routines and constant data into boot flash; thus, expanding the program memory of the PIC32 MCU. For example, a part with 128 kbytes of Flash memory actually has 140 kbytes available. There is no downside to using the boot flash, as it is located in the cacheable memory.

This document illustrates how to appropriate half of the boot flash memory for application code. The remaining portion of the boot flash is reserved for the startup code and interrupt vector table. The project, `boot_flash`, shows an example of how to place a routine in the boot flash. This project will be referenced throughout this paper.

PLACING ROUTINES AND DATA INTO BOOT FLASH

To place routines and constant data into the boot flash, you need to use a custom linker script. In the `boot_flash` project directory, there are two linker script files: `procdefs.ld` and `elf32pic32mx.ld`. (See Figure 1.) The linker script `procdefs.ld` defines the memory regions of the part, and `elf32pic32mx.ld` places the code and data into those regions. You must include `elf32pic32mx.ld` in your project to be able to place routines and data into the boot flash. (See Figure 2.) Make sure that `procdefs.ld` has the correct memory sections defined per your part.
To place the routines and data into the boot flash, you need to add the section attribute to the source file. The section attribute will place a routine or data into the section that is defined in the elf32pic32mx.ld linker script.

In the source file `main.c`, the routine “foo” is placed in the “extra_prgm_mem” section. (Figure 3.)

**FIGURE 3: ROUTINE IS ADDED TO CODE IN SOURCE FILE**

```c
int main(void)
{
    while(1)
    {
        return -1;
    }

    void __attribute__((section ("extra_prgm_mem"))) foo (void)
    {
        // set PORT B to outputs
        s5COUNTSetPinDigitalOut(BIT_0 | BIT_1 | BIT_2);
    }
}
```

In `elf32pic32mx.ld`, the “extra_prgm_mem” section is placed in the boot flash section of memory (See Figure 4.)

**FIGURE 4: LINKER SCRIPT CODE**

```ld
extra_prgm_mem :
{
    *(extra_prgm_mem)
} >kseg0_boot_mem
```

After compiling the `boot_flash` project, the map file, `boot_flash.map`, shows `foo` located at memory address 0x9FC00670, which is located in the boot flash. (See Figure 5.)

**FIGURE 5: LOCATION OF ROUTINE IN BOOT FLASH**

```
* (extra_prgm_mem) 0x9fc00670
extra_prgm_mem

0x9fc00670 0x38 main.o
0x9fc00670 foo
```

**CONCLUSION**

By using the attribute, section, and a custom linker script, you can place routines and data into PIC32MX boot flash.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV

ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, Keeloq® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
