**Features**

- Precision Voltage Monitor
  - Adjustable +4.5V or +4.75V
- Reset Pulse Width – 250 msec minimum
- No External Components
- Adjustable Watchdog Timer
  - 150 msec, 600 msec or 1.2 sec
- Operating Voltage 4.0V to 5.5V
- Debounced Manual Reset Input for External Override

**General Description**

The TC1232 is a fully-integrated processor supervisor that provides three important functions to safeguard processor sanity: precision power on/off reset control, watchdog timer and external reset override.

On power-up, the TC1232 holds the processor in the reset state for a minimum of 250 msec after V_CC is within tolerance to ensure a stable system start-up.

Microprocessor sanity is monitored by the onboard watchdog circuit. The microprocessor must provide a periodic low-going signal on the ST input. Should the processor fail to supply this signal within the selected timeout period (150 msec, 600 msec or 1200 msec), an out-of-control processor is indicated and the TC1232 issues a processor reset as a result.

The outputs of the TC1232 are immediately driven active when the PB input is brought low by an external push button switch or other electronic signal. When connected to a push button switch, the TC1232 provides contact debounce.

The TC1232 is packaged in a space-saving 8-Pin PDIP or SOIC package, a 16-Pin SOIC (wide) package and requires no external components.

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

Voltage on Any Pin (With Respect to GND)
-0.3V to +5.8V

Operating Temperature Range:
- C-Version: 0°C to +70°C
- E-Version: -40°C to +85°C

Storage Temperature Range: -65°C to +150°C

† Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Specifications: Unless otherwise noted, $T_A = T_{MIN}$ to $T_{MAX}$; $V_{CC} = +4.0$V to 5.5V.

4.0 OPERATIONAL DESCRIPTION

4.1 Power Monitor

The TC1232 provides the function of warning the processor of a power failure. When \( V_{CC} \) is detected as being below the voltage levels defined by the TOL pin, the TC1232's comparator outputs the RST and RST signals to a logic level that warns the system of an out-of-tolerance power supply. The RST and RST signals switch at a threshold value of 4.5V if TOL is tied to \( V_{CC} \), and at a value of 4.75 volts if TOL is grounded. The RST and RST signals are held active for a minimum of 250 ms to ensure that the power supply voltage has been stabilized.

Figure 4-1 shows the \( V_{CC} \) fall time.

Figure 4-2 shows the \( V_{CC} \) rise time.

Figure 4-3 shows the time from when the voltage trip point is detected to the reset output pin going active.

Figure 4-4 shows the time from when the voltage trip point is exited to the reset output pin going inactive.

\[ V_{CC} = 5V \]

\[ +4.5V \text{ (5\% Trip Point)} \]

\[ +4.25V \text{ (10\% Trip Point)} \]

\[ +4.25V \]

\[ +4.75V \]

\[ FIGURE 4-3: \text{ \( V_{CC} \) Detect Reset Output Delay (Power-Down).} \]

\[ FIGURE 4-4: \text{ \( V_{CC} \) Detect Reset Output Delay (Power-Up).} \]
4.2 Push Button Reset Input

The debounced manual reset input (PB RST) manually forces the reset outputs into their active states. Figure 4-5 shows a block diagram for using the TC1232 with a push button switch.

Once PB RST has been low for a time tPBD (the push-button delay time), the reset outputs go active. The reset outputs remain in their active states for a minimum of 250 ms after PB RST rises above VIL. Figure 4-6 shows a waveform for the push button switch input and the reset pins output.

A mechanical push button or active logic signal can drive the PB RST input. The debounced input ignores input pulses less than 1 ms and recognizes pulses of 20 ms or greater. No external pull-up resistor is required because the PB RST input has an internal pull-up to VCC of approximately 100 µA.

**FIGURE 4-5:** Push Button Reset and Watchdog Timer.

**FIGURE 4-6:** Push Button Reset – PB RST Input.

The debounced PB RST input ignores input pulses less than 1 ms and is designed to recognize pulses of 20 ms or greater.
4.3 Watchdog Timer

When the ST input is not stimulated for a preset time period, the watchdog timer function forces RST and RST signals to the active state. The preset time period is determined by the TD inputs to be 150 ms with TD connected to ground, 600 ms with TD floating or 1200 ms with TD connected to VCC (typ.). The watchdog timer starts timing-out from the set time period as soon as RST and RST are inactive. If a high-to-low transition occurs on the ST input pin prior to time-out, the watchdog timer is reset and begins to time-out again. If the watchdog timer is allowed to time-out, the RST and RST signals are driven to the active state for 250 ms, minimum (Figure 4-7).

The software routine that strobes ST is critical. The code must be in a section of software that is executed frequently enough so the time between toggles is less than the watchdog time-out period. One common technique controls the microprocessor I/O line from two sections of the program. The software might set the I/O line high while operating in the Foreground mode and set it low while in the Background or Interrupt modes. If both modes do not execute correctly, the watchdog timer issues reset pulses.

\( t_{TD} \) is the maximum elapsed time between ST high-to-low transitions (ST is activated by falling edges only), which will keep the watchdog timer from forcing the reset outputs active for a time of \( t_{RST} \). \( t_{TD} \) is a function of the voltage at the TD pin, as tabulated below:

<table>
<thead>
<tr>
<th>Condition</th>
<th>( t_{TD} ) Min</th>
<th>Typ</th>
<th>Max</th>
</tr>
</thead>
<tbody>
<tr>
<td>TD pin = 0V</td>
<td>62.5 ms</td>
<td>150 ms</td>
<td>250 ms</td>
</tr>
<tr>
<td>TD pin = Open</td>
<td>250 ms</td>
<td>600 ms</td>
<td>1000 ms</td>
</tr>
<tr>
<td>TD pin = VCC</td>
<td>500 ms</td>
<td>1200 ms</td>
<td>2000 ms</td>
</tr>
</tbody>
</table>

Figure 4-7 shows a block diagram for using the TC1232 with a PICmicro® MCU and the Watchdog input.

4.4 Supply Monitor Noise Sensitivity

The TC1232 is optimized for fast response to negative-going changes in \( V_{DD} \). Systems with an inordinate amount of electrical noise on \( V_{DD} \) (such as systems using relays) may require a 0.01 \( \mu F \) or 0.1 \( \mu F \) bypass capacitor to reduce detection sensitivity. This capacitor should be installed as close to the TC1232 as possible to keep the capacitor lead length short.
5.0 PACKAGING INFORMATION

5.1 Package Marking Information

Legend:  
XX...X  Customer-specific information  
Y       Year code (last digit of calendar year)  
YY      Year code (last 2 digits of calendar year)  
WW      Week code (week of January 1 is week '01')  
NNN     Alphanumeric traceability code  
@g     Pb-free JEDEC designator for Matte Tin (Sn)  
*       This package is Pb-free. The Pb-free JEDEC designator (@) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

APPENDIX A:  REVISION HISTORY

Revision C (June 2005)

The following is the list of modifications:
1. Since no data is given in Section 2.0 “Typical Performance Curves”, “Preliminary” was added to the bottom of this document.
2. Corrected Operating Voltage in the Electrical Specifications
3. General Data Sheet Enhancements
4. Added Revision History Appendix Section

Revision B (March 2003)

• Not logged

Revision A (March 2002)

• Original Release of this Document.
**PRODUCT IDENTIFICATION SYSTEM**

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip’s products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks
The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KeeLoq, microID, MPLAB, PIC, PICmicro, PICSTART, PRO MATE, PowerSmart, rPIC, and SmartShunt are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.
AmpLab, FilterLab, Migratable Memory, MXDEV, MXLAB, PICMASTER, SEEVAL, SmartSensor and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.
Analog-for-the-Digital Age, Application Maestro, dsPICDEM, dsPICDEM.net, dsPicworks, ECAN, ECONOMONITOR, FanSense, FlexROM, fuzzyLAB, In-Circuit Serial Programming, ICSP, ICEPIC, Linear Active Thermistor, MPASM, MPLIB, MPLINK, MPSIM, PICkit, PICDEM, PICDEM.net, PICLAB, PICtail, PowerCal, PowerInfo, PowerMate, PowerTool, rFLAB, rPICDEM, Select Mode, Smart Serial, SmartTel, Total Endurance and WiperLock are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.
SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV

ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company’s quality system processes and procedures are for its PICmicro® 8-bit MCUs, KieloLoc® code hopping devices, Serial EEPROMs, microperipherals, nonvolatible memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
